# FTP update Description

"Get Updates" will download all the latest software from my FTP site. A message will show up in the window with some information on what is new.

```

"Clean" will remove the current script files so that new ones will be created on next update. Do this the first time you run v0.0.4 and then you should not have to use "Clean" again.

"Install Web" copies the latest web files into the proper directory. Make sure nobody is using the web interface when you do this. It will delete any old files.

"Install dB" will copy a the latest version of the database into the proper directory. Make sure the database is not open when you do this. The new copy will be clean, with no data, although this first version does have three phones in the phone table. Since the old database may have data you want to save, it will be archived into a folder named with the date and time that you press the button.
